

- **Per-Task Memory Loop**

every policy is identical except the maintain step

Policy

Tool action

Context / trace

### ● Held constant

- Retrieve uses pure cosine top-k
- Solve, Reflect, Classify are identical across all six policies
- Snapshot persists the resulting memory state

### ● The only variable

- Maintain is the sole policy-specific step
- Each of the six policies forgets differently here
- All other steps are shared

### ● It is a loop

- The snapshot feeds the next task's retrieval
- Memory accumulates and is pruned per policy across the sequence
